

README

Improvement method:

I use the method (the morphology of the words) mentioned in textbook 5.8.2 (second edition) to improve the accuracy. For example, words that ending –s are likely to be NNS, words ending with –ed tend to be VBN.

Under the src directory:

To compile:

```
javac HMM/Tagger.java
```

To run:

```
java HMM.Tagger (path of training set) (path of test case)
```

And the output file named WSJ_23.pos is under src directory.
